

Credentials are targets

36% of data breaches involve phishing. One credential is harvested they often go up for sale on the Dark Web.

Humans make mistakes

90% of data breaches involve human error. Cyber criminals also continuously try to breach popular services to gain access to their credential vault.

Monitoring is vital

It is vital to get immediate notification that your credentials are up on the Dark Web for sale. If your details are exposed, then you must change your password for that service.

Detect and react when stolen credentials are found on the dark web

The benefit of dark web monitoring is that it identifies exposed data and the amount of time that your data is exposed. By actively monitoring the dark web at all times and mitigating exposed assets or identities, these tools give cybercriminals less time to exploit your confidential information, preventing further information leaks because you addressed them quickly.

Businesses that monitor the dark web can find out if they've been breached or find indicators that they are likely to be breached, as well as possibly learn who is attacking them and what methods the attackers may use.

Service Options

Dark Web Monitoring can be provided as a once off engagement, or provided as an ongoing monthly subscription service.

Benefits-at-a-glance

- **Threat intelligence.** The data captured by the dark web monitoring solution can be fed into automated threat intelligence systems and used to enrich that data.
- **Threat hunting.** Threat hunters can use dark web monitoring to speed their hunting and develop a comprehensive understanding of attackers and their methods.
- **Faster incident response.** Investigation and response workflows can be used to mitigate threats as rapidly as possible.
- **Integration into security platforms.** The data collected can be sent to other systems to formulate more accurate insights from the entire security stack.
